

PROJECT DESIGN PHASE

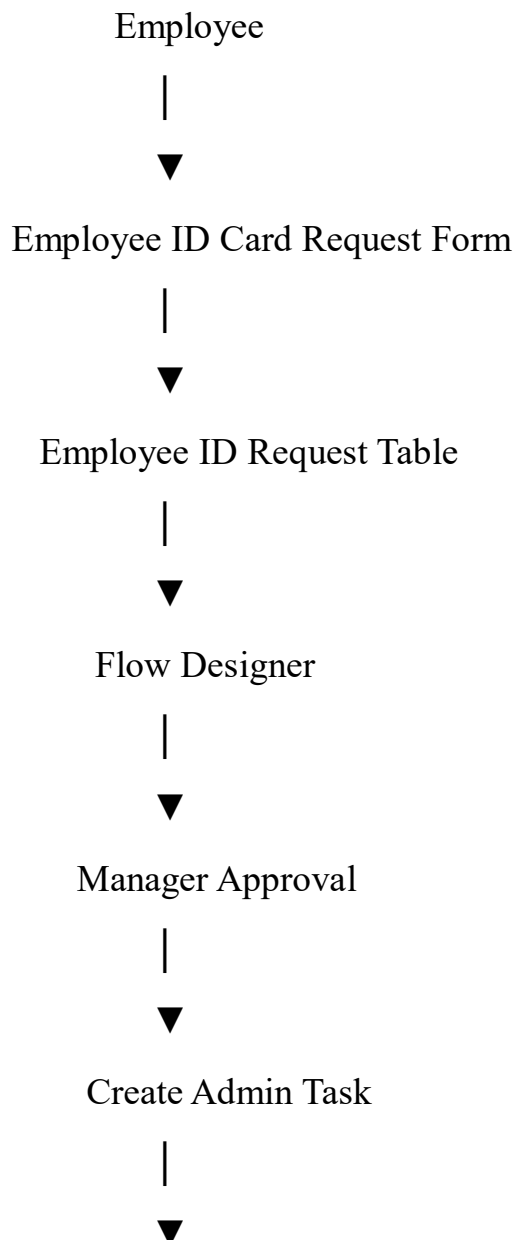

Employee ID Card Request Management System

\

2. System Architecture Design

The application follows a layered architecture where users interact with the Service Catalog, requests are stored in a custom table, and workflows are managed through Flow Designer.

System Architecture Diagram

Send Notification

Request Closed

Architecture Components

Employee

Submits ID card requests.

Catalog Item

Provides the request submission interface.

Employee ID Request Table

Stores request information.

Flow Designer

Automates approvals and task creation.

Notification Engine

Sends approval notifications.

Task Module

Creates tasks for administrative teams.

3. Database Design

A custom table was designed to store all employee ID card request information.

Table Name

Employee ID Request

Table Fields

Employee ID Request
PK : Request Number
Employee Name
Employee ID
Department
Request Type
Reason
Approval Status

Field Name	Data Type	Description
Employee Name	String	Employee name
Employee ID	String	Employee identifier
Department	Choice	Employee department
Request Type	Choice	Request category
Reason	String	Request reason
Approval Status	Choice	Approval state

4. Form Design

A structured form was designed to collect request information.

Form Layout

Section 1: Employee Details

Employee Name

Employee ID

Department

Section 2: Request Information

Request Type

Reason

Form Design Diagram

Employee ID Request Form
Employee Details
Employee Name
Employee ID
Department
Request Details
Request Type
Reason
Urgency
Submit

Design Considerations

- Easy navigation
- Mandatory field validation
- Reduced user errors

5. Catalog Item Design

A Service Catalog Item was designed to provide self-service request submission.

Catalog Item

Employee ID Card Request

Variables

Variable Name	Type
Employee Name	Single Line Text
Employee ID	Single Line Text
Department	Choice
Request Type	Choice
Reason	Multi Line Text
Urgency	Choice
Temporary ID Requested	Yes/No

6. Workflow Design

The workflow was designed using ServiceNow Flow Designer.

Workflow Diagram

Employee ID Request Created

Ask For Approval

If Approved

├─ Yes → Create Task → Send Notification

└─ No → Reject Request

Workflow Components

Trigger

Employee ID Request Created

Approval Action

Routes request for approval.

IF Condition

Checks approval status.

Create Task

Generates task for admin team.

Send Notification

Notifies employee.

11. Design Advantages

Scalability

Supports increasing request volume.

Maintainability

Components can be modified independently.

Automation

Reduces manual effort.

User Experience

Simple and intuitive interface.

Transparency

Provides request visibility.

Conclusion

The Project Design Phase defined the complete structure of the Employee ID Card Request Management System. The architecture, database design, form design, workflow design, use case model, and security design provide a strong foundation for implementation. The design ensures efficient request handling, approval automation, task generation, and employee notification while maintaining scalability and usability.
